

---

It's a cold winter out there, and with this comes a new threat: anti deep freeze all version.55. This virus arrived on the scene a few months ago and has been wreaking havoc ever since. If you can't stop your computer from freezing up, opening programs, or shutting down every five minutes during the big freeze - please follow these steps to help protect your computer from being infected. 1. Uninstall any anti-virus programs that may be installed on your device 2. Close all processes that are running in the background using Task Manager or similar apps 3. Make sure no third party apps are running at startup before booting your computer back up again 4. Use a powerful anti-virus program to scan your device for any infections that may be present 5. Update the virus definitions on your antivirus programs and make sure that they are up to date 6. Check your network and ensure that all devices (including mobile devices and other computers) and all external hard drives/flash drives/removable storage media are protected by a firewall or similar security protection software on them. Make sure that only trusted files are stored on them 7. Double check that none of your programs are running at startup, especially if you're on a public computer without an approved restart plan 8. Encrypt important documents on your computer, e.g. tax returns, account numbers, etc. if you haven't already (see link) 9. Any anti-virus programs that are running should be set to update automatically 10. Make sure that the device containing your computer is not connected to any unsecured Wi-Fi connections, especially if you're unable to take the appropriate security actions on the device 11. Be vigilant for any suspicious or unusual behavior

This virus can be found through various websites and through social media networks including Facebook and Instagram. If you notice that your computer is not functioning correctly, go ahead and follow the steps above to ensure that you don't become a victim of this evil virus: anti deep freeze all version.55. -Article by @Cj\_McCallister (McCallister Consulting Services )  
Published: January 07, 2017 new version Update: anti deep freeze all version.55 You will need the following files to eliminate this threat: \* Please save these files to external storage for reference \*

1) Run the MalwareBytes Anti-Malware scanner (MBAM). Some versions of Deep Freeze use an application called "svchost.exe." This program is automatically updated by the virus, so if you are infected, MBAM will also detect that. 2) Once the scan is complete, close MBAM. The utility deletes the downloaded file. 3) Use the same method to remove any other malware that you might have on your computer. If there are any issues, click "Show more" to see possible solutions for specific infections. 4) To completely solve this problem, run MalwareBytes Anti-Malware again and click "Quarantine Selected." Then make sure you select "C:\Program Files\Deep Freeze\Anti Deep Freeze" as an endpoint for future scanning.
