Jun 22, 2018 - I like this movie because it has some fantastic songs. I like the song Kaya Paani. External links Nagin old hindi songs full movie download at -movierulz Category:1954 films Category:Indian films Category:1950s Hindi-language films Category:Films directed by Nandlal Jaswantlal

Psychosocial adjustment and oral health-related quality of life among persons with periodontal disease. Psychosocial adjustment among persons with periodontal disease has been poorly characterized. This study aimed to determine the psychosocial impact of periodontal disease, identify the primary factors associated with psychosocial adjustment, and examine associations between psychosocial adjustment and oral health-related quality of life. Data were derived from Wave I of the Longitudinal Study of Aging, a cross-sectional epidemiological survey of community-dwelling, married and non-married adults aged 65 years and older in 6 US states. Periodontal status was based on clinical measures and self-report of number of missing teeth and of periodontal disease diagnoses. A multivariate logistic regression model was constructed to determine whether the presence of periodontal disease was associated with the following: depression, using the Geriatric Mental Health Index; social support, using the Lubben Social Network Scale; life satisfaction, using the Satisfaction With Life Scale; and oral health-related quality of life, using the OHIP-14. Of the 1,021 subjects examined, 577 (57%) reported at least one sign of periodontal disease. Of those with periodontal disease, more than half (63%) reported impaired psychosocial functioning, and 38% reported one or more symptoms of depression. After adjusting for age, race, sex, and education, the odds of reporting psychosocial difficulties were increased among those with periodontal disease relative to those without periodontal disease. The primary mediating factor for this relationship was social support (odds ratio [OR] 1.40; 95% CI 1.10-1.79). No significant association was found between periodontal disease and oral health-related quality of life. This study identified a relationship between periodontal disease and psychosocial difficulties among older adults. Social support emerged as a potentially modifiable risk factor for psychosocial dysfunction. Because psychosocial difficulties among older adults can lead to adverse outcomes, including depression and functional decline, primary and secondary
