A: The instructions are not wrong (except for the unbalanced tagline), but it is definitely not as simple as one can expect. The instructions do not say anything about which label format to use (e.g. GenCode or NuCode) and where to put it (in the main part of the label or inside the profile). The pdf file mentions in the table of contents (on page 48) that the cut files should have the \*.nul label extension. It is not clear whether the cut files must be saved as the new \*.nul format or as the old \*.atf format. I have run into this problem in the past and have found no way around it. It would have been nice to add a command line option that specifies the label format (i.e. gencode or nucode) to use for the cut files. Also it would be good to add a command line option that says where to put the \*.nul files.

Sulfasalazine therapy in patients with inflammatory bowel disease: no significant benefit or risk. The sulfasalazine (Salazopyrin) induction and maintenance therapy was evaluated for its benefit and toxicity in a double-blind, placebo-controlled, multicenter trial in patients with ulcerative colitis and Crohn's disease. Eighty-eight patients were randomized to four groups (placebo, 2 g daily, 3 g daily, and 6 g daily). Patients were evaluated for abdominal pain, diarrhea, and weight gain and were assessed for their ability to sustain the treatment regimen. The induction phase lasted up to 4 weeks, and patients received the assigned medication for 12 weeks. No statistically significant differences in clinical benefit (diarrhea, abdominal pain, weight gain) were detected among the patients treated with the different doses of sulfasalazine. Furthermore, no significant differences were found in the ability to sustain the treatment regimen. No significant differences were found among the sulfasalazine, placebo, and 2, 3, or 6 g daily treatments during the maintenance phase. Patients receiving 2 g daily had a significantly higher incidence of loose stools than those receiving placebo ( $p = 0.04$ ). No clinically relevant toxicities were detected. In conclusion, sulfasalazine at doses up to 6 g daily is well tolerated, without significant clinical benefits or risks, in patients with ulcerative colitis or Crohn's disease.
