Pros and Cons of Adobe Photoshop
Pros: Excellent editing tools, including brush and auto-paint tools. Photoshop has a very rich feature set for its price point (free) High resolution and color depth easily reach or exceed what is found on most higher-end graphics cards.

Cons: Slow performance in many circumstances if you have a sub-par graphics card, or even a system with less than the recommended 16GB of RAM. Applications are generally easier and more commonly used to create raster images, such as a photo, rather than vector artwork. CS2 vs. CS6 The most significant (and obvious) update in many years is its redesign. The version prior to CS6 was CS2. Before Photoshop CS2 was released, only one version of Photoshop was available: Photoshop 3.0. Photoshop 2.5, the first released version, was a hybrid of two separate programs: Camera RAW and Photoshop. Photoshop 3.0, however, was a complete redesign of the program to become a professional graphics application, with features that were previously found in other programs. There was also a version of Photoshop called Photoshop 3.5, but it was simply an upgrade of the 3.0 version. As the years went on, Adobe continued to improve the application, creating different versions: Photoshop 4, Photoshop 5, Photoshop 5.5, Photoshop 6, Photoshop 7, Photoshop 8, Photoshop 9, Photoshop 9.5, Photoshop 10, Photoshop 11, Photoshop CS, Photoshop CS2, Photoshop CS3, Photoshop CS4 and Photoshop CS6. However, because of the redesign of the program, most of the features and functions between previous versions are identical. Photoshop 9 and CS5 actually share many features, for example. Adobe Photoshop Photoshop CS2 and up come as a single, named program. CS stands for "Creative Suite." Before this, Photoshop used the older filename structure of CSxxx. At the top of the folder, you can see the "CS" (this is the filename structure used now), and the version number beside it. "Photoshop" is the name of the program, and the version number is the version number at the time that the software was released. The CSxxx refers to the name of the suite or collection of programs. The CS5 suite is, for example, "Creative Suite 5," which consists of the programs InDesign

Q: On the Galois connection I am studying Galois connection. I came across this note. Why $\{f_1, f_2\}$ is closed but $\{f_1, f_2\} \neq f_1' \times f_2'$ Is it because $f_1' \times f_2'$ is the difference of f_1, f_2 ? If so, it is not that intuitive... I will really appreciate if anyone can explain in much simpler terms. A: This note is wrong. In any context, $f' \times g'$ is a set of all functions of the form $f' \times g'$ where f, g are functions (maps) from a set X to a set Y . One may also define a relation as $\forall x \in X, \exists y \in Y: (x, y) \in R$. In which case, $f' \times g' = \{(f', g'): f' \in f'', g' \in g''\}$ where f'', g'' are the sets of all functions from X to Y , respectively. When dealing with the product of two relations, the definition that the author uses is the following (it is not the standard definition of a Cartesian product): $f' \times g' = \{(f', g'): \exists x \in X, \exists y \in Y: (x, y) \in f' \text{ and } (x, y) \in g'\} = \{(f', g'): \exists x \in X, \exists y \in Y: (x, y) \in f' \text{ and } (x, y) \in g'\}$.
